“Responses and Adaptation to Chronic Sleep Loss, Associated Costs, and Underlying Mechanisms”

Chronic sleep loss is common in our societies, and negatively impacts performance and health. To understand the consequences of chronic sleep loss and underlying mechanisms, my laboratory has developed a rodent model of chronic sleep restriction. I will present our recent findings on the neurobehavioural and physiological consequences, and possible roles of BDNF and FosB family gene proteins in these responses and adaptation. The role of astrocytes in sleep regulation will also be discussed.

Speaker: Dr. Kazue Semba
Department of Medical Neuroscience,
Dalhousie University

Date: Friday, May 16, 2014
Time: 15:00-16:00
Venue: Room #402, 4F, Health and Medical Science Innovation Laboratory, University of Tsukuba

Contact: International Institute for Integrative Sleep Medicine
Phone: 029-853-5857 (ext. 5857)
