“Possible involvement of low-grade systemic inflammation in sensorimotor gating deficits: a study of a ‘schizophrenia-like’ mouse model”

Recently, low-grade systemic inflammation has attracted notable attention in psychiatric disease or metabolic syndrome research, including obesity. High-fat diet (HFD) mice show not only low-grade systemic inflammation but also sensorimotor gating deficits, a characteristic phenotype observed in schizophrenia. Focusing on HFD mice as an animal model of schizophrenia, I will discuss the mechanism of inducing sensorimotor gating deficits and the possible role of inflammatory cytokines in the pathogenesis of schizophrenia. The relationship between inflammatory cytokines and sleep disorders will also be discussed.

Speaker:  Dr. Chisato Wakabayashi
Department of Mental Disorder Research
National Institute of Neuroscience
National Center of Neurology and Psychiatry

Date:  Wednesday, February 25, 2015
Time:  14:00-15:00
Venue:  Room #402, 4F, Health and Medical Science Innovation Laboratory, University of Tsukuba
